1. India Compared with 5 countries.

India is one of the fastest-growing producers of e-waste in the world. According to the uploaded paper, India's e-waste generation increased from 1.97 million tonnes in 2015 to 3.23 million tonnes in 2019, representing the highest growth rate among the countries studied.

Compared with China, which is the world's largest e-waste generator, India produces a smaller total volume but is growing at a much faster rate.

The United States is the second-largest generator and has a more developed recycling infrastructure.

Germany and the United kingdom have strong e-waste management systems under the European Union's WEEE directives, allowing them to formally collect and recycle more than half of their e-waste.

Japan also has an advanced recycling system supported by strict legislation and efficient collection mechanisms.

In contrast, India still relies heavily on the informal sector for e-waste collection and recycling, although its regulatory framework is steadily improving.

2. Initiatives Taken by India for E-Waste Management

India has introduced several initiatives to improve e-waste management and promote environmentally sound recycling.
The government first introduced the E-Waste (Management and Handling) Rules, 2011, which were last strengthened through the E-Waste (Management) Rules, 2016, introducing Extended Producer Responsibility (EPR) that makes manufacturers responsible for collecting and recycling discard electronic products.
More recently, the E-Waste (Management) Rule, 2022 established a digital EPR portal, mandatory registration of producers and recyclers and annual recycling targets.
The Central Pollution Control Board (CPCB) monitors compliance through online EPR portal, while authorized collection centers and recycling facilities have been expanded.
